

Mechanical Load Distribution

(Athanasίου et. al 2009)

- Axial loads on the femur are transmitted through the meniscus, generating hoop stresses.
- Tensile forces (hoop stresses) resist radial extrusion and help maintain knee joint stability.

Meniscal Injuries

(Athanasίου et. al 2009)

Types of Tears

Radial Tear: Small tear from the inner edge outward.

Longitudinal Tear: Tear along the meniscus curve.

Oblique Tear: Angled tear creating a flap.

Horizontal Tear: Split between top and bottom layers.

Complex Tear: Combination of multiple tear types.

Bucket-Handle Tear: Displaced flap causing joint locking.
